User-task App

App description: A web app that allows the user to login and view his/her profile details.

After login with email and password the user is directed to a profile page with his details.

- The user profile details are kept in firestore. The user doc id is the firebase uid.
- The user authentication is done using firebase authentication
- The password is verified to include letters and numbers and to be longer than 6 characters
- The email must be a valid email address

I also implemented the bonus assignment which allows the user to update his profile details.

I decided to implement my app using react and used the Bootstrap library for easier page formatting.

Deployment was done with firebase hosting

The following users were manually added to the firestore table for testing:

Email	Password
roy@gmail.com	Rr123456
noga@gmail.com	Nn123456
gil@gmail.com	Gg123456
nati@gmail.com	Nn123456
chicki@gmail.com	Cc123456
